

A QUADRATIC DOUBLE DIRICHLET SERIES II: THE NUMBER FIELD CASE

HENRY TWISS

ABSTRACT. We construct a quadratic double Dirichlet series $Z(s, w)$ built from single variable quadratic Dirichlet L -functions $L(s, \chi)$ over \mathbb{Q} . We prove that $Z(s, w)$ admits meromorphic continuation to the (s, w) -plane and satisfies a group of functional equations.

1. PRELIMINARIES

We present an overview of quadratic Dirichlet L -functions over \mathbb{Q} . We begin with the Riemann zeta-function. The zeta function $\zeta(s)$ is defined as the Dirichlet series or Euler product

$$\zeta(s) = \sum_{m \geq 1} \frac{1}{m^s} = \prod_{p \text{ prime}} \left(1 - \frac{1}{p^s}\right)^{-1},$$

for $\operatorname{Re}(s) > 1$. The second equality is an analytic reformulation of the fundamental theorem of arithmetic. The Riemann zeta function also admits meromorphic continuation to \mathbb{C} with a simple pole at $s = 1$ of residue 1. The functional equation is

$$\pi^{-\frac{s}{2}} \Gamma\left(\frac{s}{2}\right) \zeta(s) = \pi^{-\frac{1-s}{2}} \Gamma\left(\frac{1-s}{2}\right) \zeta(1-s).$$

Now we recall characters on \mathbb{Z} . They are multiplicative functions $\chi : \mathbb{Z} \rightarrow \mathbb{C}$. The two flavors of characters of interest to use are: **Todo: [Characters modulo 8 and no Hilbert symbols]**

- Dirichlet characters: multiplicative functions $\chi_d : \mathbb{Z} \rightarrow \mathbb{C}$ modulo $d \geq 1$ (in that they are d -periodic) and such that $\chi_d(m) = 0$ if $(m, d) > 1$.
- Hilbert symbols: Dirichlet characters modulo 1.

In either case, the image always lands in the roots of unity. If χ is a Dirichlet character then its conjugate $\bar{\chi}$ is also a Dirichlet character. Moreover, $\bar{\chi}$ is the multiplicative inverse to χ and the Dirichlet characters modulo m form a group under multiplication. This group is always finite and its order is $\phi(d) = |(\mathbb{Z}/d\mathbb{Z})^*|$. Dirichlet characters also satisfy orthogonality relations:

Theorem 1.1 (Orthogonality relations).

(i) For any two Dirichlet characters χ and ψ modulo d ,

$$\frac{1}{\phi(d)} \sum'_{a \pmod{d}} \chi(a) \bar{\psi}(a) = \delta_{\chi, \psi}.$$

(ii) For any $a, b \in (\mathbb{Z}/d\mathbb{Z})^*$,

$$\frac{1}{\phi(d)} \sum_{\chi \pmod{d}} \chi(a) \bar{\chi}(b) = \delta_{a, b}.$$

The Dirichlet characters that are of interest to us are those given by the quadratic residue symbol on \mathbb{Z} . First let us recall this symbol. For any odd prime p and any $m \geq 1$, we define the quadratic residue

symbol $\left(\frac{m}{p}\right)$ by

$$\left(\frac{m}{p}\right) \equiv m^{\frac{p-1}{2}} \pmod{p} = \begin{cases} 1 & \text{if } x^2 \equiv m \pmod{p} \text{ is solvable,} \\ -1 & \text{if } x^2 \equiv m \pmod{p} \text{ is not solvable,} \\ 0 & \text{if } m \equiv 0 \pmod{p}. \end{cases}$$

This symbol only depends upon m modulo p and is multiplicative in m . We can extend the quadratic residue symbol multiplicatively in the denominator. If $d = p_1^{e_1} p_2^{e_2} \cdots p_k^{e_k}$ is the prime factorization of d , then we define

$$\left(\frac{m}{d}\right) = \prod_{1 \leq i \leq k} \left(\frac{m}{p_i}\right)^{e_i}.$$

So the quadratic residue symbol now makes sense for any odd $d \geq 1$. We can extend this symbol further and allow $d \geq 1$ to be even. To this end, we define

$$\left(\frac{m}{2}\right) = \begin{cases} 1 & \text{if } m \equiv 1, 7 \pmod{8}, \\ -1 & \text{if } m \equiv 3, 5 \pmod{8}, \\ 0 & \text{if } m \equiv 0 \pmod{2}, \end{cases}$$

and extend $\left(\frac{m}{d}\right)$ multiplicatively in d when d is even. Now the quadratic residue symbol makes sense for any $m, d \geq 1$. Moreover, it is multiplicative in both m and d but no longer depends upon only m modulo d (it also depends upon m modulo 8). In particular,

$$\left(\frac{-1}{d}\right) = \begin{cases} 1 & d \equiv 1 \pmod{4}, \\ -1 & d \equiv 3 \pmod{4}, \\ 0 & d \equiv 0 \pmod{2}, \end{cases} \quad \text{and} \quad \left(\frac{2}{d}\right) = \begin{cases} 1 & d \equiv 1, 7 \pmod{8}, \\ -1 & d \equiv 3, 5 \pmod{8}, \\ 0 & d \equiv 0 \pmod{2}, \end{cases}$$

and if $d \not\equiv 0 \pmod{2}$, we can compactly write

$$\left(\frac{-1}{d}\right) = (-1)^{\frac{d-1}{2}} = \begin{cases} 1 & d \equiv 1 \pmod{4}, \\ -1 & d \equiv 3 \pmod{4}, \end{cases} \quad \text{and} \quad \left(\frac{2}{d}\right) = (-1)^{\frac{d^2-1}{8}} = \begin{cases} 1 & d \equiv 1, 7 \pmod{8}, \\ -1 & d \equiv 3, 5 \pmod{8}. \end{cases}$$

The quadratic residue symbol also admits the following reciprocity law:

Theorem 1.2 (Quadratic reciprocity). *If $d, m \geq 1$ are relatively prime, then*

$$\left(\frac{d}{m}\right) = (-1)^{\frac{d^{(2)}-1}{2} \frac{m^{(2)}-1}{2}} \left(\frac{m}{d}\right),$$

where $d^{(2)}$ and $m^{(2)}$ are the parts of d and m relatively prime to 2 respectively.

We can now define the quadratic Dirichlet characters. For any odd square-free $d \geq 1$, define the quadratic Dirichlet character χ_d by the following quadratic residue symbol:

$$\chi_d(m) = \begin{cases} \left(\frac{d}{m}\right) & \text{if } d \equiv 1 \pmod{4}, \\ \left(\frac{4d}{m}\right) & \text{if } d \equiv 2, 3 \pmod{4}. \end{cases}$$

This quadratic Dirichlet character is attached to the quadratic extension $\mathbb{Q}(\sqrt{d})$. We extend χ_d multiplicatively in the denominator so that χ_d makes sense for any odd $d \geq 1$. In particular, $\chi_d(m) = \pm 1$ provided d and m are relatively prime and $\chi_d(m) = 0$ if $(m, d) > 1$. Quadratic reciprocity implies that χ_d is a Dirichlet character modulo d if $d \equiv 1 \pmod{4}$ and is a Dirichlet character modulo $4d$ if $d \equiv 2, 3 \pmod{4}$. Indeed, if $d \equiv 1 \pmod{4}$ then $d^{(2)} = d$ and the sign is always 1. If $d \equiv 3 \pmod{4}$, then $d^{(2)} = d$ and the sign is $\left(\frac{-1}{m}\right)$ which is a character modulo 4. If $d \equiv 2 \pmod{4}$, then $d^{(2)} \equiv 1, 3 \pmod{4}$ and we are reduced

to one of the previous two cases. To compactify these statements, we use the Dirichlet characters modulo 8:

$$\psi_1, \quad \psi_{-1}, \quad \psi_2, \quad \text{and} \quad \psi_{-2} \text{ \color{red}Todo : [XXX]}$$

This is a Hilbert symbol as we will now see. The only Hilbert symbols we will need are those given by the quadratic residue symbol. There are only two of them: one nontrivial and one trivial. The nontrivial Hilbert symbol is χ_θ where $\theta \in \mathbb{F}^\times - (\mathbb{F}^\times)^2$:

$$\chi_\theta(m) = (-1)^{\deg(m)}.$$

Note that $\overline{\chi_\theta} = \chi_\theta$. The other Hilbert symbol is the trivial Dirichlet character $\chi_\theta^2 = \chi_{\theta\theta} = \chi_1$. In general, we denote a Hilbert symbol by χ_a where $a \in \{1, \theta\}$. The Hilbert symbols are necessary because they control the possible sign change in the statement of quadratic reciprocity coming from the $\text{sgn}(d)^{\deg(m)}$ and $\text{sgn}(m)^{-\deg(d)}$ factors. Technically speaking, we would also require Hilbert symbols to keep track of the $(-1)^{\frac{q-1}{2} \deg(d) \deg(m)}$ factor but as we will assume $q \equiv 1 \pmod{4}$, we will not discuss this additional difficulty.

\color{red}Todo: [XXXXXX]

With the Dirichlet characters and Hilbert symbols introduced, we are ready to discuss the L -functions associated to quadratic Dirichlet characters. We define the L -function $L(s, \chi_d)$ attached to χ_d by a Dirichlet series or Euler product:

$$L(s, \chi_d) = \sum_{m \text{ monic}} \frac{\chi_d(m)}{|m|^s} = \prod_{P \text{ monic irr}} \left(1 - \frac{\chi_d(P)}{|P|^s}\right)^{-1}.$$

By definition of the quadratic Dirichlet character, $L(s, \chi_d) \ll \zeta(s)$ for $\text{Re}(s) > 1$ so that $L(s, \chi_d)$ is locally absolutely uniformly convergent in this region. $L(s, \chi_d)$ also admits meromorphic continuation to \mathbb{C} with a simple pole at $s = 1$ if d is a perfect square and is analytic otherwise (see [?] for a proof). Moreover, $L(s, \chi_d)$ is a polynomial in q^{-s} of degree at most $\deg(d) - 1$. The completed L -function is defined as follows:

$$L^*(s, \chi_d) = \begin{cases} \frac{1}{1-q^{-s}} L(s, \chi_d) & \text{if } \deg(d) \text{ is even,} \\ L(s, \chi_d) & \text{if } \deg(d) \text{ is odd,} \end{cases}$$

and satisfies the functional equation

$$L^*(s, \chi_d) = \begin{cases} q^{2s-1} |d|^{\frac{1}{2}-s} L^*(1-s, \chi_d) & \text{if } \deg(d) \text{ is even,} \\ q^{2s-1} (q|d|)^{\frac{1}{2}-s} L^*(1-s, \chi_d) & \text{if } \deg(d) \text{ is odd.} \end{cases}$$

Note that in the case $\deg(d)$ is even, the conductor is $|d|$ and in the case $\deg(d)$ is odd, the conductor is $q|d|$. In other words, the gamma factors depend upon the degree of d . This will cause a small but important technical issue later when we want to derive functional equations for the quadratic double Dirichlet series.
